

How does Puretouch[®] work?

Developed and manufactured in the UK, Puretouch[®] is a self-adhesive antimicrobial surface wrap embedded with the active ingredient Microbic[®] AMS001 which prevents the growth of microorganisms. Designed to adhere to your building's touchpoints reducing the spread of bacteria by contaminated surfaces in-between cleanings. Puretouch[®] helps provide peace of mind that these surfaces are safe to touch, encouraging a return to normal business and a healthier environment in the office, schools, hospital, hospitality and travel.

How should I clean Puretouch[®] products?

Puretouch[®] surfaces are not affected by traditional non-abrasive cleaners. We recommend wiping the surface with a microfiber cloth and water to remove large-scale contaminants. Do not use abrasive cleaners or cleaning utensils which might compromise the Puretouch[®] surface.

How long do Puretouch[®] products last and when should I replace?

We recommend replacing facility touch point skins every 90 days (quarterly). In some high traffic applications they may need to be replaced more often. Nothing gets used up or expires, so the products' shelf life is virtually unlimited. Product life is dependent on actual physical wear. The easiest rule to follow is to replace the skins quarterly and the other products annually. If the skins start to peel off, we recommend replacement to keep the touch point looking good.
